

Break Statement

- The **break** statement which was borrowed from C, **breaks out** of the innermost enclosing **for** or **while** loop;
- If break statement is inside a nested loop (loop inside another loop), break will terminate the innermost loop;
- The **else** clause of the for loop is executed when the loop is not terminated by a break statement

```
for item in sequence:
    #code inside for loop
    if condition is True:
        break
    #other code inside for loop
#code outside for loop
```
